The Concept

1 Note that the apposing sides of the wedge are flat and the side toward band/tooth are biometrically concave

2 The image shows how intimately the wedges "nest" into each other.

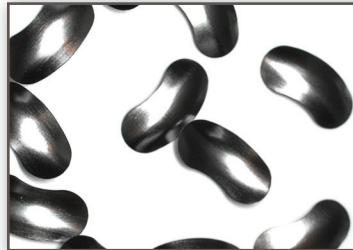

3 The red area illustrates the groove in receiving wedge matches and guides the tip of the counter wedge in red.

1

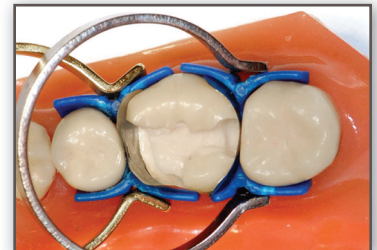

ABC Wedge with sectional matrices

1 ML cusp missing. Distal box within normal limits.

2 Sectional matrices work well for MOL and DO requirements.

3 Both MegaRings provide separation and stability. Gold is preferred in most situations for perfect alignment.

2

ABC Wedge with Tofflemer

1 Entire lingual aspect is fractured/decayed off. Tofflemer is the only option.

2 A full contour Tofflemer is modified to eliminate buccal overlap.

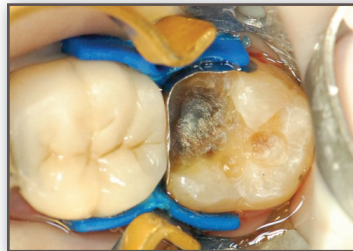

3 Two gold MegaRings create separation and stability.

3

ABC Wedge Clinical Case, DOL Composite

1 Failed Amalgam.

2 ABC Wedge supports the matrix.

3 Final restoration.
